

check angular acceleration

Pre-condition: System is initialised

(Controller)

1. check angular acceleration

(AngularAccelerationControl)

2. retrieve angular acceleration
3. call sense hat driver
4. calculate angular velocity from angular acceleration
5. add initial angular velocity to retrieved velocity
6. calculate rotational energy
7.
 - a. robot is stationary
 - b. robot is moving

[route a]

8.
 - a. rotational energy is lower than max for stationary
 - b. rotational energy is higher than max for stationary

[route b]

9.
 - a. rotational energy is lower than max for moving
 - b. rotational energy is higher than max for moving

(LEDControl)

[route aa]

9. light matrix BLUE

[route ab]

9. light matrix RED

[route ba]

9. light matrix BLUE

[route bb]

9. light matrix RED

(Controller)

10. wait for next period

Post-condition: Matrix is lit in appropriate color
